Intel x86 Processors

- **Dominate laptop/desktop/server market**
- **Evolutionary design**
 - Backwards compatible up until 8086, introduced in 1978
 - Added more features as time goes on
- **Complex instruction set computer (CISC)**
 - Many different instructions with many different formats
 - But, only small subset encountered with Linux programs
 - Hard to match performance of Reduced Instruction Set Computers (RISC)
 - But, Intel has done just that!
 - In terms of speed. Less so for low power.

x86 Clones: Advanced Micro Devices (AMD)

■ Historically

- AMD has followed just behind Intel
- A little bit slower, a lot cheaper

■ Then

- Recruited top circuit designers from Digital Equipment Corp. and other downward trending companies
- Built Opteron: tough competitor to Pentium 4
- Developed x86-64, their own extension to 64 bits

■ Recent Years

- Intel got its act together
 - Leads the world in semiconductor technology
- AMD has fallen behind
 - Relies on external semiconductor manufacturer

Intel's 64-Bit History

- **2001: Intel Attempts Radical Shift from IA32 to IA64**
 - Totally different architecture (Itanium)
 - Executes IA32 code only as legacy
 - Performance disappointing
- **2003: AMD Steps in with Evolutionary Solution**
 - x86-64 (now called “AMD64”)
- **Intel Felt Obligated to Focus on IA64**
 - Hard to admit mistake or that AMD is better
- **2004: Intel Announces EM64T extension to IA32**
 - Extended Memory 64-bit Technology
 - Almost identical to x86-64!
- **All but low-end x86 processors support x86-64**
 - But, lots of code still runs in 32-bit mode

Assembly/Machine Code View

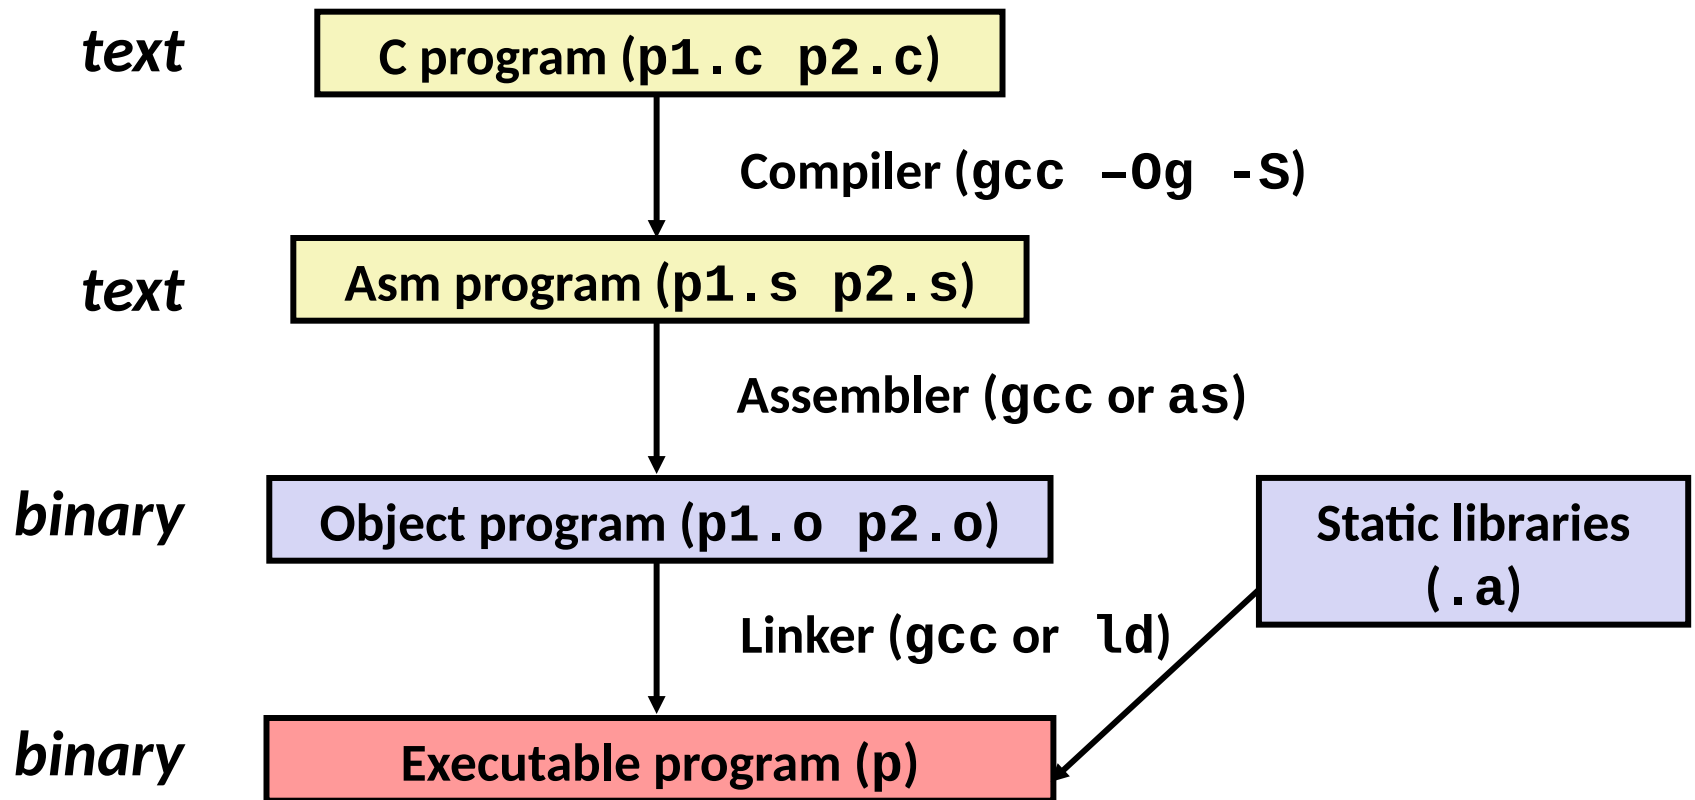

Programmer-Visible State

- **PC: Program counter**

Turning C into Object Code

- Code in files **p1.c** **p2.c**
- Compile with command: **gcc -Og p1.c p2.c -o p**
 - Use basic optimizations (**-Og**) [New to recent versions of GCC]
 - Put resulting binary in file **p**

Compiling Into Assembly

C Code (sum.c)

```
long plus(long x, long y);  
  
void sumstore(long x, long y,  
              long *dest)  
{  
    long t = plus(x, y);  
    *dest = t;  
}
```

Generated x86-64 Assembly

```
sumstore:  
    pushq    %rbx  
    movq     %rdx, %rbx  
    call     plus  
    movq     %rax, (%rbx)  
    popq     %rbx  
    ret
```

Obtain with command

```
gcc -Og -S sum.c
```

Produces file sum.s

Warning: Will get different results on different machines due to different versions of gcc and different compiler settings.

Address Computation Instruction

■ **leaq Src, Dst**

- Src is address mode expression
- Set Dst to address denoted by expression

■ **Uses**

- Computing addresses without a memory reference
 - E.g., translation of `p = &x[i];`
- Computing arithmetic expressions of the form $x + k * y$
 - $k = 1, 2, 4, \text{ or } 8$

■ **Example**

```
long m12(long x)
{
    return x*12;
}
```

Converted to ASM by compiler:

```
leaq (%rdi,%rdi,2), %rax # t <- x+x*2
salq $2, %rax           # return t<<2
```

Some Arithmetic Operations

■ Two Operand Instructions:

Format	Computation	
addq Src, Dest	$\text{Dest} = \text{Dest} + \text{Src}$	
subq Src, Dest	$\text{Dest} = \text{Dest} \sim \text{Src}$	
imulq Src, Dest	$\text{Dest} = \text{Dest} * \text{Src}$	
salq Src, Dest	$\text{Dest} = \text{Dest} \ll \text{Src}$	Also called shlq Arithmetic Logical
sarq Src, Dest	$\text{Dest} = \text{Dest} \gg \text{Src}$	
shrq Src, Dest	$\text{Dest} = \text{Dest} \gg \text{Src}$	
xorq Src, Dest	$\text{Dest} = \text{Dest} \wedge \text{Src}$	
andq Src, Dest	$\text{Dest} = \text{Dest} \& \text{Src}$	
orq Src, Dest	$\text{Dest} = \text{Dest} \text{Src}$	

■ Watch out for argument order!

■ No distinction between signed and unsigned int (why?)

Some Arithmetic Operations

■ One Operand Instructions

incq Dest Dest = Dest + 1

decq Dest Dest = Dest - 1

negq Dest Dest = - Dest

notq Dest Dest = ~Dest

■ See book for more instructions

Arithmetic Expression Example

```
long arith
(long x, long y, long z)
{
    long t1 = x+y;
    long t2 = z+t1;
    long t3 = x+4;
    long t4 = y * 48;
    long t5 = t3 + t4;
    long rval = t2 * t5;
    return rval;
}
```

arith:

```
leaq    (%rdi,%rsi), %rax
addq    %rdx, %rax
leaq    (%rsi,%rsi,2), %rdx
salq    $4, %rdx
leaq    4(%rdi,%rdx), %rcx
imulq   %rcx, %rax
ret
```

Interesting Instructions

- **leaq**: address computation
- **salq**: shift
- **imulq**: multiplication
 - But, only used once

Understanding Arithmetic Expression

Example

```
long arith
(long x, long y, long z)
{
    long t1 = x+y;
    long t2 = z+t1;
    long t3 = x+4;
    long t4 = y * 48;
    long t5 = t3 + t4;
    long rval = t2 * t5;
    return rval;
}
```

```
arith:
    leaq    (%rdi,%rsi), %rax    # t1
    addq    %rdx, %rax          # t2
    leaq    (%rsi,%rsi,2), %rdx
    salq    $4, %rdx            # t4
    leaq    4(%rdi,%rdx), %rcx   # t5
    imulq    %rcx, %rax          # rval
    ret
```

Register	Use(s)
%rdi	Argument x
%rsi	Argument y
%rdx	Argument z
%rax	t1, t2, rval
%rdx	t4
%rcx	t5
