Streams – Part 2

Reduction Stream Operations

Reduce

Sum

E.g. find the number of words in an input file

```java
try {
    Stream<String> lines = Files.lines(Paths.get("file.txt"));
    lines
        .map(line -> line.split(" ").length)
        .reduce(Integer::sum)
        .ifPresent(System.out::println);
} catch (IOException e) {
    System.out.println(e.getMessage());
}
```

This version of `reduce` takes as parameter a `BinaryOperator<T>` instance, which serves as an associative accumulator. In this example, the associative accumulator is the `sum` method in the `Integer` class. The return type of this reduce is `Optional<T>`

The accumulator function must be an associative function because the accumulation process is not guaranteed to work through the stream items sequentially

Reduce – `IntStream/(seed,IntBinaryOperator)`

Product – Using an identity element as seed

E.g. find the factorial of n

```
IntStream is = IntStream.rangeClosed(1,n);
int fact = is.reduce(1,(x,y) -> x*y);
```

identity   IntBinaryOperator

stream

```
1.  x=seed, y=1, prod=1*1
2.  x=1,    y=2, prod=1*2
3.  x=2,    y=3, prod=2*3
4.  x=3,    y=4, prod=3*4
...
    x=(n-1)!,y=n,prod=n!
```

Reduce – `mapToInt/IntStream/sum`

Sum method, numeric stream

```
try {
    Stream<String> lines = Files.lines(Paths.get("file.txt"));
    System.out.println(
     lines
      .mapToInt(line -> line.split(" ").length)
      .sum()
    );
} catch (IOException e) {
    System.out.println(e.getMessage());
}
```

Returns an `IntStream`

Can also do max and min reductions on `IntStream`

Reduce

E.g. find the average star rating of all movies in `movies` list

```
Optional<Integer> opt =
    movies.stream()          returns Stream<Movie>
        .map(Movie::getRating)     returns Stream<Integer>
        .reduce(Integer::sum);

try {
    System.out.println(opt.get()*1f/movies.stream().count());
} catch (NoSuchElementException e) {
    System.out.println("No movies in list");
}
```

The `Optional` class's `get` method returns the contained value, or throws a `NoSuchElementException` if none exists

Reduce – Averaging with `IntStream`

E.g. find the average star rating of all movies in `movies` list

```
OptionalDouble optDbl =
    movies.stream()
        .mapToInt(Movie::getRating)        ⟵  returns IntStream
        .average();

System.out.println(optDbl.orElse(0));
```

flatMap
(Very Cool Stream Operation!)

Useful Stream Operations

Example without `flatMap`

```
List<Integer> l1 = Arrays.asList(2,3,7,9);
Stream<int[]> strm =
        l1.stream()
           .map(i -> new int[]{1,i});

strm.forEach(a -> System.out.println(Arrays.toString(a)));
```

```
[1,2]
[1,3]
[1,7]
[1,9]
```

Useful Stream Operations

Example without `flatMap`

```
List<Integer> l1 = Arrays.asList(2,3,7,9);
List<Integer> l2 = Arrays.asList(4,5,8);

Stream<Stream<int[]>> strm2 =
        l1.stream()
          .map(i -> l2.stream()
                      .map(j -> {new int[]{i,j}));

strm2.forEach(System.out::println);
```

```
java.util.stream.ReferencePipeline$3@53d8d10a
java.util.stream.ReferencePipeline$3@e9e54c2
java.util.stream.ReferencePipeline$3@65ab7765
java.util.stream.ReferencePipeline$3@1b28cdfa
```

Each item in strm2 is a
stream of `int[]`

```
[2,4]
[2,5]
[2,8]
.............
[3,4]
[3,5]
[3,8]
.............
[7,4]
[7,5]
[7,8]
.............
[9,4]
[9,5]
[9,8]
```

Useful Stream Operations

Example without `flatMap`

```java
List<Integer> l1 = Arrays.asList(2,3,7,9);
List<Integer> l2 = Arrays.asList(4,5,8);

Stream<Stream<int[]>> strm2 =
        l1.stream()
          .map(i -> l2.stream()
                      .map(j -> {new int[]{i,j}));

strm2.forEach(System.out::println);

strm2.forEach(s -> s.forEach(System.out::println));
```

Each item output
is an `int[]`

```
[I@1b28cdfa        [2,4]
[I@eed1f14         [2,5]
[I@7229724f        [2,8]
[I@4c873330        [3,4]
[I@119d7047        [3,5]
[I@776ec8df        [3,8]
[I@4eec7777        [7,4]
[I@3b07d329        [7,5]
[I@41629346        [7,8]
[I@404b9385        [9,4]
[I@6d311334        [9,5]
[I@682a0b20        [9,8]
```

Useful Stream Operations

Example without `flatMap`

```
List<Integer> l1 = Arrays.asList(2,3,7,9);
List<Integer> l2 = Arrays.asList(4,5,8);

Stream<Stream<int[]>> strm2 =
      l1.stream()
        .map(i -> l2.stream()
                    .map(j -> {new int[]{i,j}));

strm2.forEach(s -> s.forEach(System.out::println));
strm2.forEach(s -> s.forEach(a -> System.out.println(Arrays.toString(a))));
```

Print contents of
each `int[]`

```
[2,4]
[2,5]
[2,8]
[3,4]
[3,5]
[3,8]
[7,4]
[7,5]
[7,8]
[9,4]
[9,5]
[9,8]
```

flatmap

With `flatMap`

```
List<Integer> l1 = Arrays.asList(2,3,7,9);
List<Integer> l2 = Arrays.asList(4,5,8);

Stream<int[]> strm2 =
        l1.stream()
          .flatMap(i -> l2.stream()
                          .map(j -> {new int[]{i,j}));
strm2.forEach(s -> s.forEach(a -> System.out.println(Arrays.toString(a))));

strm2.forEach(a -> System.out.println(Arrays.toString(a));
```

Nested `Stream<int[]>` has been flattened into a sequence of `int[]`

Print contents of each array `int[]`

```
[2,4]
[2,5]
[2,8]
[3,4]
[3,5]
[3,8]
[7,4]
[7,5]
[7,8]
[9,4]
[9,5]
[9,8]
```

flatMap

E.g. Find the average word length in an input file

The rabbit-hole went straight on like a tunnel for some way,
and then dipped suddenly down, so suddenly that Alice had not
a moment to think about stopping herself before she found herself
falling down a very deep well. Either the well was very deep,
or she fell very slowly, for she had plenty of time as she went
down to look about her and to wonder what was going to happen next.
First, she tried to look down and make out what she was coming to,
but it was too dark to see anything; then she looked at the sides
of the well, and noticed that they were filled with cupboards
and book-shelves; here and there she saw maps and pictures hung
upon pegs.

flatMap

We need to extract words from each line, then get their lengths

```java
try {
    Stream<String> lines = Files.lines(Paths.get("alice.txt"));
    lines
        .map(line -> line.split(" "))
        .forEach(System.out::println);
} catch (IOException e) {
    System.out.println(e.getMessage());
}
```

What does this print?

Each line of output is an array of words in the lines of the input file

The map function in the code converts `Stream<String>` to `Stream<String[]>`

```
[Ljava.lang.String;@7cc355be
[Ljava.lang.String;@6e8cf4c6
[Ljava.lang.String;@12edcd21
[Ljava.lang.String;@34c45dca
[Ljava.lang.String;@52cc8049
[Ljava.lang.String;@5b6f7412
[Ljava.lang.String;@27973e9b
[Ljava.lang.String;@312b1dae
[Ljava.lang.String;@7530d0a
[Ljava.lang.String;@27bc2616
[Ljava.lang.String;@3941a79c
```

flatMap

But we need a `Stream<String>` of individual words, so we may get their lengths, then average

So, "flatten" the Stream<String[]> to Stream<String>

```java
try {
    Stream<String> lines = Files.lines(Paths.get("alice.txt"));
    lines
        .map(line -> line.split(" "))
        .flatMap(Arrays::stream)
        .forEach(System.out::println);
} catch (IOException e) {
    System.out.println(e.getMessage());
}
```

The arrays produced in the first map is flattened out into their constituent words by the second

```
The
rabbit-hole
went
straight
on
like
a
tunnel
...
```

flatMap

So now we can map the words to their lengths, and get the average

```java
try {
    Stream<String> lines = Files.lines(Paths.get("alice.txt"));

    OptionalDouble avg =
    lines
        .map(line -> line.split(" "))
        .flatMap(Arrays::stream)
        .mapToInt(String::length)
        .average();

    avg.ifPresent(System.out::println);
} catch (IOException e) {
    System.out.println(e.getMessage());
}
```

4.224

Using IntStream (instead of Stream)

Try with `IntStream` instances:

```
int[] arr1 = {2,3,7,9};
IntStream is1 = Arrays.stream(arr1);

is1.map(i -> new int[]{1,i})
   .forEach(a -> System.out.println(Arrays.toString(a)));
```

Won't compile because the map function to `IntStream` must
result in another `IntStream`, but here we are trying for a `Stream<int[]>`

flatMap

Convert to `stream<Integer>` instead with `boxed()`,
then apply `Stream.map`

```
IntStream is1 = Arrays.stream(arr1);
IntStream is2 = Arrays.stream(arr2);

Stream<int[]> pairs =
is1.boxed()            ⟵  returns Stream<Integer>
    .flatMap(i ->
                is2.boxed()   Arrays.stream(arr2).boxed()

             .map(j -> new int[]{i,j}));
```

returns `Stream<Integer>`

Won't work because the stream `is2` is
used up for the first item of `is1`,
and will be closed.

A new stream will have to
be opened on `arr2` for
EVERY item in `is1`

```
pairs
    .forEach(p -> System.out.println(Arrays.toString(p)));
```

flatMap

Alternatively, can apply `IntStream.mapToObj` to second stream, instead of using box

```
IntStream is1 = Arrays.stream(arr1);

Stream<int[]> pairs =
is1.boxed()
   .flatMap(i ->
               Arrays.stream(arr2)
                    .mapToObj(j -> new int[]{i,j}));

   pairs
      .forEach(p -> System.out.println(Arrays.toString(p)));
```

Converting Stream to Array

The `Stream` method `toArray()` converts a stream to an array:

```
String[] badMovies =
    movies.stream()
            .filter(m -> m.getRating() < 3)
            .map(Movie::getName)
            .toArray(String[]::new);
```

Without the supplier parameter, `toArray` will produce an array of `Object` instances, which cannot be cast to an array of another type:

```
String[] badMovies = (String[])          This cast does
    movies.stream()                       not work
            ...
            .toArray();
```

Converting numeric stream to array

The `IntStream` method `toArray()` does not accept a parameter, and returns an `int[]`

```java
int[] squares =
    Arrays.stream(new int[]{1,2,3,4,5})
          .map(i -> i*i)
          .toArray();
```

The `DoubleStream` and `LongStream()` numeric streams work similarly, with toArray() returning `double[]` and `long[]`, respectively.

Useful Stream Operations

Operation	Return Type	Type Used
filter	Stream<T>	Predicate<T>
distinct	Stream<T>	
limit	Stream<T>	long
map	Stream<R>	Function<T,R>
flatMap	Stream<R>	Function<T, Stream<R>>
sorted	Stream<T>	Comparator<T>
anyMatch/noneMatch/allMatch	boolean	Predicate<T>
findAny/findFirst	Optional<T>	
forEach	void	Consumer<T>
collect	R	Collector<T,A,R>
reduce	Optional<T>	BinaryOperator<T>
count	long
